# On Maximum Induced Matching Numbers of Special Grids 

Tayo Charles Adefokun and Deborah Olayide Ajayi

#### Abstract

A subset $M$ of the edge set of a graph $G$ is an induced matching of $G$ if given any two edges $e_{1}, e_{2} \in M$, none of the vertices on $e_{1}$ is adjacent to any of the vertices on $e_{2}$. Suppose that $\operatorname{Max}(G)$, a positive integer, denotes the maximum size of $M$ in $G$, then, $M$ is the maximum induced matching of $G$ and $\operatorname{Max}(G)$ is the maximum induced matching number of $G$. In this work, we obtain upper bounds for the maximum induced matching number of grid $G=G_{n, m}, n \geq 9, m \equiv 3 \bmod 4, m \geq 7$, and $n m$ odd.

AMS Subject Classification: 05C70, 05C15.
Keywords and Phrases: Induced matching; Grid; Maximum induced matching number; Strong matching number.

## 1. Introduction

For a graph $G$, let $V(G), E(G)$ be vertex and edge sets respectively and let $e \in E(G)$. We define $e=u v$, where $u, v \in V(G)$ and the respective order and size of $V(G)$ and $E(G)$ are $|V(G)|$ and $|E(G)|$. For some $M \subseteq E(G), M$ is an induced matching of $G$ if for all $e_{1}=u_{i} u_{j}$ and $e_{2}=v_{i} v_{j}$ in $M, u_{k} v_{l} \notin M$, where $k$ and $l$ are from $\{i, j\}$. Induced matching, a variant of the matching problem, was introduced in 1982 by Stockmeyer and Vazirani [10] and has also been studied under the names strong matching [7] and "risk free" marriage problem [8]. It has found theoretical and practical applications in a lot of areas including network problems and cryptology [3]. For more on induced matching and its applications, see [2], [3], [4], [5] and [11].

The size $|M|$ of an induced matching $M$ of $G$ is a positive integer and translates as the maximum induced matching number $\operatorname{Max}(G)$ (or strong matching number) of
$G$ if $|M|$ is maximum. Obtaining $\operatorname{Max}(G)$ is $N P$-hard, even for regular bipartite graphs [4]. However, $\operatorname{Max}(G)$ of some graphs have been found in polynomial time such as the cases in [3], [6].

A grid $G_{n, m}$ is the Cartesian product of two paths $P_{n}$ and $P_{m}$, resulting in $n$-rows and $m$-columns. Marinescu-Ghemaci in [9], obtained the $\operatorname{Max}(G)$ for $G_{n, m}$, grid where both $n, m$ are even; either of $n$ and $m$ is even and for quite a number of grids $G_{n, m}$ where $n m$ is odd, which is called the odd grid in [1]. Marinescu-Ghemaci [9] also gave useful lower and upper bounds and conjectured that the $\operatorname{Max}(G)$ of grids can be found in polynomial time and also by combining the maximum induced numbers of partitions of odd grids, Marinescu-Ghemaci confirmed that for any odd grid $G \equiv G_{n, m}$, $\operatorname{Max}(G) \leq\left\lfloor\frac{n m+1}{4}\right\rfloor$. This bound was improved on in [1] for the case where $n \geq 9$ and $m \equiv 1 \bmod 4$.

In this paper, the Marinescu-Ghemaci's bound for the case where $n \geq 9$ and $m \equiv 3$ $\bmod 4$ is considered and more compact values are obtained. The results in this work, combined with some of the results in [9], confirm the maximum induced matching numbers of certain graphs, whose lower bounds were established in [9].

## 2. Definitions and Preliminary Results

Grid, $G_{n, m}$, as defined in this work, is the Cartesian product of paths $P_{n}$ and $P_{m}$ with $V\left(P_{n}\right)=\left\{u_{1}, u_{2}, \cdots, u_{n}\right\}$ and $V\left(P_{m}\right)=\left\{v_{1}, v_{2}, \cdots, v_{m}\right\}$. We adopt the following notations which are similar to those in [1]:

$$
\begin{array}{ll}
V_{i}=\left\{u_{1} v_{i}, u_{2} v_{i}, \cdots, u_{n} v_{i}\right\} \subset V\left(G_{n, m}\right), & i \in[1, m], \\
U_{i}=\left\{u_{i} v_{1}, u_{i} v_{2}, \cdots, u_{i} v_{m}\right\} \subset V\left(G_{n, m}\right), & i \in[1, n] .
\end{array}
$$

For edge set $E\left(G_{n, m}\right)$ of $G_{n, m}$, if $\left(u_{i} v_{j} u_{k} v_{j}\right) \in E\left(G_{n, m}\right)$ and $\left(u_{i} v_{j} u_{i} v_{k}\right) \in E\left(G_{n, m}\right)$, we write $u_{(i, k)} v_{j} \in E\left(G_{n, m}\right)$ and $u_{i} v_{(j, k)} \in E\left(G_{n, m}\right)$ respectively.

A saturated vertex $v$ is any vertex on some edge in $M$, otherwise, $v$ is unsaturated, cf. [1]. We define $v$ as saturable if it can be saturated relative to the nearest saturated vertex. Any vertex that is at least distant- 2 from the nearest saturated vertex is saturable. By this definition, therefore, it is clear that a saturated vertex is at first saturable. However, not every saturable vertex is saturated. The set of all saturable vertices on a graph $G$ is denoted by $V_{s b}(G)$ while the set of saturated vertices is $V_{s t}(G)$. Clearly, $\left|V_{s t}(G)\right|$ is even and $V_{s t}(G) \subseteq V_{s b}(G)$. Free saturable vertex set $(F S V)$ is the set of saturable vertices which can not be on any members of $M$. In other words, $v \in F S V$ is a saturable vertex of graph $G$, which is not adjacent to some saturable vertex $u \in G$. Note that $F S V=V_{s b} \backslash V_{s t}$. Let $G$ be a $G_{n, m}$ grid. We define $G^{|k|}$ as a $G_{n, k}$ subgraph of $G$ induced by $\left\{V_{i+1}, V_{i+2}, \cdots, V_{i+k}\right\}$. An unsaturated vertex $v \in G$ is unsaturable if $v \notin F S V$ and $v \notin V_{s b}(G)$. Furthermore, for positive integers $a$ and $b$, $a<b,[a, b]:=\{a, a+1, \cdots, b\}$.

The following results from [9] on $G$, a $G_{n, m}$ grid, are useful in this work:
Lemma 2.1. Let $m, n \geq 2$ be two positive integers and let $G$ be a $G_{n, m}$ grid. Then,
(a) If $m \equiv 2 \bmod 4$ and $n$ odd then $\left|V_{s b}(G)\right|=\frac{m n+2}{2}$; and $\left|V_{s b}(G)\right|=\frac{m n}{2}$ otherwise;
(b) for $m \geq 3$, $m$ odd, $\left|V_{s b}(G)\right|=\frac{n m+1}{2}$, for $n \in\{3,5\}$.

Theorem 2.2. Let $G$ be a $G_{n, m}$ grid with $2 \leq n \leq m$. Then,
(a) if $n$ even and $m$ even or odd, then $\operatorname{Max}(G)=\left\lceil\frac{m n}{4}\right\rceil$;
(b) if $n \in\{3,5\}$ then for
(i) $m \equiv 1 \bmod 4, \operatorname{Max}(G)=\frac{n(m-1)}{4}+1$,
(ii) $m \equiv 3 \bmod 4, \operatorname{Max}(G)=\frac{n(m-1)+2}{4}$.

The following theorem is the statement of the bound given by Marinescu-Ghemaci [9].

Theorem 2.3. Let $G$ be a $G_{n, m}$ grid, $m, n \geq 2$, mn odd. Then $\operatorname{Max}(G) \leq\left\lfloor\frac{m n+1}{4}\right\rfloor$.

## 3. Maximum Induced Matching Number of Odd Grids

The following lemma and the remark describe the importance of the saturation status of certain vertices in $G_{5, p}$ grid, where $p \equiv 2 \bmod 4$.

Lemma 3.1. Let $G$ be a $G_{n, m}$ grid and let $\left\{V_{i+1}, V_{i+2}, \cdots, V_{i+p}\right\} \subset G$ induce $G^{|p|}$, $a G_{5, p}$ subgrid of $G$, where $p \equiv 2 \bmod 4$. Suppose that $M_{1}$, is an induced matching of $G^{|p|}$ and that for $u_{3} v_{i+1} \in V_{i+1} \subset V\left(G^{|p|}\right), u_{3} v_{i+1} \notin V_{s t}\left(G^{|p|}\right)$. Then, $V_{s t}\left(G^{|p|}\right) \leq$ $10 k+4$, for positive integer $k$, where $p=4 k+2$ and $M_{1}$ is not a maximum induced matching of $G^{|p|}$.

Proof. For a positive integer $k$, let $p=4 k+2, G^{|2|}$ and $G^{|p-2|}$ be partitions of $G_{1}$, induced by $\left\{V_{i+1}, V_{i+2}\right\}$ and $\left\{V_{i+3}, V_{i+4}, \cdots, V_{i+p}\right\}$, respectively. Since $u_{3} v_{i+1}$ is not saturated in $G^{|2|}$, it easy to check that $\left|V_{s b}\left(G^{|2|}\right)\right|=5$. From [9], $\left|V_{s b}\left(G^{|p-2|}\right)\right|=$ $\left|V_{s t}\left(G^{|p-2|}\right)\right|=10 k$. Thus $\left|V_{s b}\left(G^{|p|}\right)\right| \leq\left|V_{s b}\left(G^{|2|}\right)\right|+\left|V_{s b}\left(G^{|p-2|}\right)\right| \leq 10 k+5$ and therefore, $\left|V_{s t}\left(G^{|p|}\right)\right| \leq 10 k+4$ since $\left|V_{s t}(G)\right|$ is even, for any graph $G$. This is a contradiction since by [9], $\left|V_{s t}\left(G^{|p|}\right)\right|=10 k+6$.

Remark 3.2. It should be noted that $M_{1}$ in Lemma 3.1 will still not be a maximum induced matching of $G^{|p|}$ if for the vertex set $A=\left\{u_{1} v_{i+1}, u_{5} v_{i+1}, u_{1} v_{i+p}, u_{3} v_{i+p}, u_{5} v_{i+p}\right\}$ $\subset V\left(G^{|p|}\right)$, any member of $A$ is unsaturated.

Lemma 3.3. Suppose $u_{(1,2)} v_{i}, u_{5} v_{(i-1, i)} \in M$ or $u_{(1,2)} v_{i}, u_{5} v_{(i, i+1)} \in M$, where $M$ is an induced matching of $G$, a $G_{5, m}$ grid, $m \equiv 3 \bmod 4, m \geq 23$ and $1<i<m$, $i \notin\{4, m-3\}$. Then $M$ is not a maximum induced matching of $G$.

Proof. Let $G$ be partitioned into $G^{|m(1)|}$ and $G^{|m(2)|}$, which are induced respectively by $A=\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and $B=\left\{V_{i+1}, V_{i+2}, \cdots, V_{m}\right\}$. Suppose that $M$ is a maximum induced matching of $G$.

## Case 1: $i \equiv 1 \bmod 4$.

Let $m=4 k+3$ and set $i=4 t+1$, where $k \geq 5$ and $t>0$. Then, $|m(1)| \equiv 1 \bmod 4$ and $|m(2)| \equiv 2 \bmod 4$. Since $u_{1} v_{i}, u_{2} v_{i}, u_{5} v_{i}$ and $u_{5} v_{i-1}$ are saturated vertices in $V_{i}$ and $V_{i-1}$, then the only $F S V$ member on $V_{i-1}$ is $u_{3} v_{i-1}$. Suppose that $u_{3} v_{i-1}$ remains unsaturated. Let $G^{|m(3)|} \subset G^{|m(1)|}$ be induced by $\left\{V_{1}, V_{2}, \cdots, V_{i-2}\right\}$, where $|m(3)| \equiv 3$ $\bmod 4$. By $[9],\left|V_{s t}\left(G^{|m(3)|}\right)\right|=10 t-4$. Thus, $\left|V_{s t}\left(G^{|m(1)|}\right)\right| \leq 10 t$. Suppose that $u_{3} v_{i-1}$ is saturated, then, $u_{3} v_{(i-1, i-2)} \in M$. Thus, $u_{3} v_{i-3} \in V_{i-3} \subset G^{|m(4)|}$ is unsaturable, where $G^{|m(4)|}$ is $G^{|m(3)|} \backslash V_{i-2}$. Note that $|m(4)| \equiv 2 \bmod 4 . \quad$ From Lemma 3.1, therefore, $\left|V_{s t}\left(G^{|m(4)|}\right)\right| \leq 10 t-6$ and thus, $\left|V_{s t} G^{|m(1)|}\right| \leq 10 t-6+6=10 t$. Now, since $u_{1} v_{i}, u_{2} v_{i}$ and $u_{5} v_{i}$ are saturated vertices in $V_{i}$, then, $u_{3} v_{i+1}, u_{4} v_{i+1} \in V\left(G^{|m(2)|}\right)$ are saturable vertices in $G^{|m(2)|}$.
Claim: Edge $u_{(3,4)} v_{i+1}$ belongs to $M$.
Reason: Suppose that both $u_{3} v_{i+1}$ and $u_{4} v_{i+1}$ are not saturated, then $V_{i+1}$ contains no saturable vertices. Let $G^{|m(2)|} \backslash\left\{V_{i+1}\right\}=G^{|m(5)|}$, where $|m(5)| \equiv 1 \bmod 4$. Thus, $\left|V_{s t}(G)\right| \leq\left|V_{s t} G^{|(m(1))|}\right|+\left|V_{s t}\left(G^{|m(5)|}\right)\right|=10 k+2$, which is less than the required saturated vertices by 4 and hence the claim. Now, $u_{(3,4)} v_{i+1}$ belongs to M. Clearly for $G^{|m(5)|}$ defined above, $\left|V_{s b}\left(G^{|m(5)|}\right)\right|=10(k-t)+3$ and suppose $u_{3} v_{i+1}, u_{4} v_{i+1} \in V_{s t}(G)$, then $\left|V_{s t}(G)\right| \leq 10 k+5$. In fact, $\left|V_{s t}(G)\right|=10 k+4$. Thus establishing the first part of the case that with $u_{(1,2)} v_{i}, u_{5} v_{(i-1, i)} \in M, M \neq \operatorname{Max}(G)$.

For the second part of the case, suppose that $u_{(1,2)} v_{i}, u_{5} v_{(i, i+1)} \in M$. Let $G^{|n(1)|}=$ $G^{|m(1)|} \backslash\left\{V_{i}\right\}$ and $G^{|n(2)|}=G^{|m(2)|} \cup\left\{V_{i}\right\}$. Now, $|n(1)| \equiv 0 \bmod 4$ and $|n(2)| \equiv 3$ $\bmod 4$. Consequently, $\left|V_{s t}\left(G^{|n(2)|}\right)\right|=10(k-t)+6$. Now, on $V_{i-1} \subset G^{|n(1)|}$, only vertices $u_{3} v_{i-1}$ and $u_{4} v_{i-1}$ are saturable. Suppose they are both not saturated after all. Let $G^{|n(3)|} \subset G^{|n(1)|}$ be induced by $\left\{V_{1}, V_{2}, \cdots, V_{i-2}\right\}$, where $|n(3)| \equiv 3 \bmod 4$. $\left|V_{s t}\left(G^{|n(3)|}\right)\right|=10 t-4$. Thus $\left|V_{s t}(G)\right|=10 k+2$. Therefore, $M$ requires four saturated vertices to be a maximum induced matching of $G$. Now, $\left|V_{s b}\left(G^{|n(3)|}\right)\right|=10 t-2$, and thus, $V\left(G^{|n(3)|}\right)$ contains two extra $F S V$ vertices, say, $v_{1}, v_{2}$ which are not adjacent. Thus, the maximum number of saturable vertices from the vertex set $\left\{v_{1}, v_{2}, u_{3} v_{i-1}, u_{4} v_{i-1}\right\}$ is 2 . Therefore, $\left|V_{s t}(G)\right| \leq 10 k+4$, which is a contradiction. Case 2: $i \equiv 2 \bmod 4$.
Let $G^{|p(1)|}$ and $G^{|p(2)|}$ be partitions of $G$ induced by $\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and $\left\{V_{i+1}, V_{i+2}\right.$, $\left.\cdots, V_{m}\right\}$, with $m=4 k+3$ and $i=4 t+2$. Let $u_{(1,2)} v_{i}$ and $u_{5} v_{(i-1, i)} \in M$. Since $u_{(1,2)} v_{i}$ belongs in $M$ of $G$, then $u_{3} v_{i}$ cannot be saturated. Thus, $\left|V_{s t}\left(G^{|p(2)|}\right)\right| \geq$ $10(k-t)+2$ for $M$ to be maximal. It can be seen that $|p(2)| \equiv 1 \bmod 4$. Now, $u_{3} v_{i+1}$ and $u_{4} v_{i+1}$ are saturable vertices in $V_{i+1}$. Suppose both of them are not saturated, then for $G^{|p(3)|}$ induced by $\left\{V_{i+2}, V_{i+3}, \cdots, V_{m}\right\}$, where $|p(3)| \equiv 0 \bmod 4$, $\left|V_{s t}\left(G^{|p(3)|}\right)\right| \leq 10(k-t)$. Thus $u_{3} v_{i+1}$ and $v_{4} v_{i+1}$ are saturable vertices and in fact, $u_{(3,4)} v_{i+1} \in M$. On $V_{i+2}$, therefore, there exists three saturable vertices $u_{1} v_{i+1}, u_{2} v_{i+2}$ and $u_{5} v_{i+5}$. Suppose none of these three vertices are saturated. Then, $\left|V_{s t}\left(G^{|p(3)|}\right)\right| \leq$ $\left|V_{s t}\left(G^{|p(4)|}\right)\right|+2$, with $G^{|p(4)|}$ induced by $\left\{V_{i+3}, \cdots, V_{m}\right\}$ and $|p(4)| \equiv 3 \bmod 4$ and thus, $\left|V_{s t}\left(G^{|p(2)|}\right)\right| \leq 10(t-k)-2$. Therefore it requires extra four saturated vertices
for $M$ to be maximum. There exist two other saturable vertices, $v_{1}, v_{2} \in V\left(G^{|p(4)|}\right)$ (since $V_{s t}\left(G^{|p(4)|}\right)=10(k-t)-4$ and $\left.V_{s b}\left(G^{|p(4)|}\right)=10(k-t)-2\right)$. Clearly, $v_{1}, v_{2}$ are not adjacent, else they would have formed an edge in $M$. Suppose $v_{1}, v_{2} \in V_{i+3}$. For $v_{1}$ and $v_{2}$ to be saturated, they have to be $u_{5} v_{i+3}$ and one of $u_{1} v_{i+3}$ and $u_{2} v_{i+3}$. Thus, $u_{5} v_{i+2, i+3} \in M$ and one of $u_{1} v_{(i+2, i+3)} u_{2} v_{(i+2, i+3)}$ or $u_{(1,2)} v_{i+2}$ belongs to M. Let $G^{|p(5)|}$ be induced by $\left\{V_{i+4}, \cdots, V_{m}\right\}$, where $|p(5)| \equiv 2 \bmod 4$. Now, since $v_{5} v_{(i+2, i+3)} \in M$, then $u_{5} v_{i+5} \in V_{i+4}$ is unsaturable and therefore, by Remark 3.2, $\left|V_{s t}\left(G^{|p(5)|}\right)\right|=10(k-t-1)+4$ and thus, $\left|V_{s t}\left(G^{|p(2)|}\right)\right|=10(k-t)$, which is less than required. The case of $u_{5} v_{(i, i+1)} \in M$ is the same as the case of $u_{5} v_{(i-1, i)} \in M$ for $i \equiv 2 \bmod 4$.
Case 3: $i \equiv 0 \bmod 4, i \geq 6$ or $i \leq m-5$, with $u_{(1,2)} v_{i}, u_{5} v_{(i-1, i)} \in M$. Let $G^{|r(1)|}$ and $G^{|r(2)|}$ be partitions of $G$ which are induced respectively by $\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and $\left\{V_{i+1}, V_{i+2}, \cdots, V_{m}\right\}$. Since $i \equiv 0 \bmod 4$, then $|r(1)| \equiv 0 \bmod 4$, while $|r(2)| \equiv 3$ $\bmod 4$. Also, $u_{5} v_{(i-1, i)} \in M$, implies $u_{5} v_{i-1}$ is unsaturable. Since $i-2 \equiv 2 \bmod 4$, then by Lemma 3.1 and Remark 3.2, $\left|V_{s t}\left(G^{|r(1)|}\right)\right| \leq 10 t-2$, implying that for $M$ to be maximal, $\left|V_{s t}\left(G^{|r(2)|}\right)\right| \geq 10(k-t)+8$. It can be seen that $V_{i+1}$ has two only saturable vertices $u_{3} v_{i+1}, u_{4} v_{i+2}$ left. It should also be noted that if any of $u_{3} v_{i+1}$ and $u_{4} v_{i+2}$ is saturated, then $u_{3} v_{i+3}$ can not be saturated in $G^{|r(3)|}$, a subgrid of $G^{|r(2)|}$ induced by $\left\{V_{i+2}, V_{i+3}, \cdots, V_{m}\right\}$, with $|r(3)| \equiv 2 \bmod 4$. Thus suppose $u_{3} v_{i+1}, u_{4} v_{i+2} \in V_{s t}(G)$, then $\left|V_{s t}(G)\right| \leq 10(k-t)+4$. Likewise, if $u_{3} v_{i+1}, u_{4} v_{i+2} \notin$ $V_{s t}(G),\left|V_{s t}(G)\right| \leq 10 t-2+10(k-t)+6$. The case of $u_{5} v_{(i, i+1)} \in M$ follows the same argument as the case of $u_{5} v_{(i-1, i)} \in M$.

Figure 1: A Grid $G \equiv G_{5,23}$ with $\operatorname{Max}(G)=28, u_{(1,2)} v_{1}, u_{(1,2)} v_{4} \in M$ of $G$

## Remark 3.4.

(a) In the case of $i \equiv 0 \bmod 4$ in Lemma 3.3, $M$ remains a maximum induced matching when $i=4$ or when $i=m-3$ as seen in Figure 1 of $\operatorname{Max}(G)=28$ of $G_{5,23}$.
(b) It should be noted that the case of $i \equiv 3 \bmod 4$ has been taken care of by the case of $i \equiv 1 \bmod 4$ by 'flipping' the grid from right to left or vice versa.
(c) From Lemma 3.3, we note that if for some induced matching $M$ of $G_{5, m}, m \equiv 3$ $\bmod 4, u_{(1,2)} v_{i}$ and $u_{5} v_{(i-1, i)}\left(\right.$ or $\left.u_{5} v_{(i, i+2)}\right) \in M$, then $M$ is not a maximal induced matching of $G$ for any $1<i<m$.

Next we investigate some induced matching $M$ of $G_{5, m}$ if it contains $u_{(1,2)} v_{i}$ and $u_{(4,5)} v_{i}$.

Lemma 3.5. Suppose $G=G_{5, m}$, where $m \geq 23$ and $m \equiv 3 \bmod 4$. Let $u_{(1,2)} v_{i}$,$u_{(4,5)} v_{i} \in M$, an induced matching of $G$ and $1<i<m, i \not \equiv 0 \bmod 4$ then $M$ is not a maximum induced matching of $G$.

Proof. Let $M$ be an induced matching of $G=G_{5, m}$. Suppose that $i \equiv 2$ $\bmod 4$. Let $G^{|m(1)|}$ and $G^{|m(2)|}$ be partitions of $G$ induced by $\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and $\left\{V_{i+1}, V_{i+2}, \cdots, V_{m}\right\}$. Since $u_{(1,2)} v_{i}, u_{(4,5)} v_{1} \in M$, then, $u_{3} v_{i}$ is unsaturated. Let $i=4 t+2$, for some positive integer $t$, by Lemma 3.3, $\left|V_{s t}\left(G^{|m(1)|}\right)\right|=10 t+4$. Now, only $u_{3} v_{i+1}$ is saturable on $V_{i+1}$. Let $G^{|m(3)|} \subset G^{|m(2)|}$, induced by $\left\{V_{i+2}, \cdots, V_{m}\right\}$. Clearly $|m(3)|=|m(2)|-1=4(k-t)$. Therefore, $\left|V_{s t}\left(G^{|m(3)|} \cup u_{3} v_{i}\right)\right| \leq 10(k-t)+1$, which, in fact, is $10(k-t)$. Thus, $\left|V_{s t}(G)\right|=10 k+4$.

Now, suppose $i \equiv 1 \bmod 4$. Let $G^{|n(1)|}$ be induced by $\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and let $G^{|n(2)|}$ be induced by $\left\{V_{i+1}, V_{i+2}, \cdots, V_{m}\right\}$. Since $|n(1)|=4 t+1$, it is easy to see that $|n(2)| \equiv 2 \bmod 4$ and hence, $|n(2)|=4(k-t)+2$.
Claim: For $M$ to be maximum, both $u_{3} v_{i-1}$ and $u_{3} v_{i+1}$ must be saturated.
Reason: Suppose, say $u_{3} v_{i-1}$ is not saturated. Then, no vertex on $V_{i-1}$ is saturable. Now, let $\left\{V_{1}, V_{2}, \cdots, V_{i-2}\right\}$ induce grid $G^{|n(3)|}$, with $|n(3)| \equiv 3 \bmod 4$. Then, $\left|V_{s t}\left(G^{|n(3)|}\right)\right|=10 t-4$, and thus, $G^{|n(1)|}=10 t$. Also, let $G^{|n(4)|}$ be induced by $\left\{V_{i+2}, V_{i+3}, \cdots, V_{m}\right\}$. Since $|n(4)|=4(k-t)+1$, then for $G^{|n(4)|}+u_{5} v_{i+1}$, $\left|V_{s b}\left[\left(G^{|n(4)|}\right) \cup u_{3} v_{i+1}\right]\right|=10(k-t)+4$. Therefore, $\left|V_{s t}(G)\right| \leq 10 k+4$. Now suppose $u_{3} v_{(i-2, i-1)} \in M$ and let $G^{|n(5)|}$ be induced by $\left\{V_{1}, V_{2}, \cdots, V_{i-3}\right\}$, with $|n(5)| \equiv 2$ $\bmod 4$. By Lemma 3.1, $\left|V_{s t}\left(G^{|n(5)|}\right)\right|=10 t-6$. Thus, $\left|V_{s t}\left(G^{|n(1)|}\right)\right|=10 t$ and therefore, $\left|V_{s t}(G)\right| \leq 10 k+4$, which is less than required number by at least 2 . Hence, $M \neq \operatorname{Max}(G)$.

Remark 3.6. Like in Remark 3.4, for $i \equiv 0 \bmod 4$, it can be seen that $u_{(1,2)} v_{1}, u_{(1,2)} v_{4}$ or $u_{(1,2)} v_{m-3}, u_{(1,2)} v_{m}$ can be in $M$ if $M$ is a maximum induced matching of $G$. Also given $i \equiv 0 \bmod 4$ and $4<i<m-3$, for at most one $i$ in [4, m-3] for which $u_{(1,2)} v_{i}$ can be a member of maximal $M$.

Next we investigate the maximality of the induced matching of $G=G_{5, m}, m \equiv 3$ $\bmod 4$.

Lemma 3.7. Let $u_{(1,2)} v_{i}, u_{4} v_{(i-1, i)} \in M$ or $u_{(1,2)} v_{i}, u_{4} v_{(i, i+1)} \in M$, where $M$ is an induced matching of $G$, a $G_{5, m}$ grid, $m \equiv 3 \bmod 4, m \geq 23$ and $1<i<m, i \not \equiv 0$ $\bmod 4$. Then $M$ is not a maximum induced matching of $G$.

Proof. Case 1: $i \equiv 1 \bmod 4$.
Suppose that $m=4 k+3$ and $i=4 t+1, t \geq 1$. Let $G^{|m(1)|}$ and $G^{|m(2)|}$ be two partitions of $G$, induced by $\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and $\left\{V_{i+1}, V_{i+2}, \cdots, V_{m}\right\}$, respectively. Since $u_{(1,2)} v_{i}, u_{4} v_{(i-1, i)} \in M$, then there is no other saturated vertex on both of $V_{i-1}$ and $V_{i}$. Let $G^{|m(3)|} \subset G^{|m(1)|}$ be a grid induced by $\left\{V_{1}, V_{2}, \cdots, V_{i-2}\right\}$. Now, $n(3) \equiv 3$ $\bmod 4$. Therefore, $\left|V_{s t}\left(G^{|m(3)|}\right)\right|=10 t-4$ and hence, $\left|V_{s t}\left(G^{|m(1)|}\right)\right|=10 t$. Now, $|m(2)| \equiv 2 \bmod 4$, since $u_{(1,2)} v_{i} \in M$, then $u_{1} v_{i+1} \in V_{i+1}$ is unsaturable. From a previous result, $\left|V_{s t}\left(G^{|n(2)|}\right)\right|=10(k-t)+4$ and thus, $\left|V_{s t}(G)\right|=10 k+4$. For $u_{4} v_{(i, i+1)} \in M$, let $G^{|n(1)|}$ and $G^{|n(2)|}$ be induced by $G^{|m(1)|} \backslash V_{i}$ and $G^{|m(2)|} \cup V_{i}$. Then, $|n(1)| \equiv 0 \bmod 4$ and $|n(2)|=4(k-t)+3$. It can be seen that on $V_{i-1}$, only $u_{3} v_{i-1}$ and $u_{5} v_{i-1}$ are saturable vertices.
Claim: Vertices $u_{3} v_{i-1}$ and $u_{5} v_{i-1}$ are not saturable for $M$ to be maximal.
Reason: Suppose without loss of generality, that any of $u_{3} v_{i-1}$ and $u_{5} v_{i-1}$ is saturated, say $u_{5} v_{i-1}$. Then $u_{5} v_{(i-2, i-1)} \in M$. This implies that $v_{5} v_{i-3}$ is not saturable in $V_{i-3}$. Now $\left\{V_{1}, V_{2}, \cdots, V_{i-3}\right\}$ induces a grid $G^{(|n(4)|)}$ and $|n(4)| \equiv 2 \bmod 4$. Then, $\left|V_{s t}\left(G^{|m(4)|}\right)\right|=10 t-6$ and thus, $\left|V_{s t}\left(G^{|n(1)|}\right)\right|=10 t-4$. Now, since $|n(2)|=4(k-t)+3$, $\left|V_{s t}\left(G^{|m(2)|}\right)\right|=10(k-t)+6$ and therefore, $\left|V_{s t}(G)\right|=10 k+2$.
Case 2: $i \equiv 2 \bmod 4$.
Let $G^{|n(1)|}$ and $G^{|n(2)|}$ be two partitions of $G$, induced by $\left\{V_{1}, V_{2}, \cdots, V_{i}\right\}$ and $\left\{V_{i+1}, V_{i+2}, \cdots, V_{m}\right\}$ respectively. Since $u_{(1,2)} v_{i}$ and $u_{4} v_{(i-1, i)} \in M$, vertex $u_{5} v_{i} \in$ $V_{s b}\left(G^{|n(1)|}\right)$, and therefore, $\left|V_{s t} G^{|n(1)|}\right|=10 t+4$, where $|n(1)|=4 t+2$. Also, only $u_{3} v_{i+1}$ and $u_{5} v_{i+1}$ are saturable on $V_{i+1}$. Suppose without loss of generality, that both $u_{3} v_{i+1}$ and $u_{5} v_{i+1}$ are saturated and thus, $u_{3} v_{(i+1, i+2)}, u_{5} v_{(i+1, i+2)} \in M$. Now, suppose that $G^{|n(4)|}$ is induced by $\left\{V_{i+3}, V_{i+4}, \cdots, V_{m}\right\}$, with $|n(4)|=4(k-t-1)+3$. By following the techniques employed earlier, it can be shown that $\left|V_{s t}(G)\right| \leq$ $\left|V_{s t}\left(G^{|n(1)|}\right)\right|+\left|V_{s t}\left(G^{|n(2)|}\right)\right| \leq 10 k+4$. The $u_{4} v_{(i, i+4)}$ case, has the same proof as the $u_{4} v_{(i-1, i)}$ case.

Figure 2: A $G \equiv G_{5,23}$ Grid with $\operatorname{Max}(G)=28, u_{1,2} v_{i} \in M, i \equiv 0 \bmod 4$

## Remark 3.8.

(a) There can be only one edge $u_{(1,2)} v_{i} \in M$ for which $M$ is the maximum induced matching of $G_{5, m}$, if $M$ contains $u_{(1,2)} v_{i}$ and $u_{4} v_{(i-1, i)}\left(\right.$ or $\left.u_{4} v_{(i, i+1)}\right)$, and in this case, $i \equiv 0 \bmod 4$ as shown in Figure 2.
(b) It should be noted that the proof of the case $i \equiv 1 \bmod 4$ in Lemma 3.7 will hold for $i \equiv 3 \bmod 4$ by flipping the grid from right to left.
The previous results and remarks yield the following conclusion.
Corollary 3.9. Suppose that $m \geq 23$ and $M$ is the maximum induced matching of $G$, some $G_{5, m}$ grid. Then, if for at most some positive integer $i, 1<i<m, u_{(1,2)} v_{i} \in M$, then, $i \equiv 0 \bmod 4$.

Lemma 3.10. Let $M$ be a matching of $G_{5, m}$ with $m \equiv 3 \bmod 4$ and let $u_{(1,2)} v_{i}$, $u_{(1,2)} v_{j} \in M, 1<i<j<m$, such that $i \equiv 0 \bmod 4$ and $j \equiv 0 \bmod 4$, then $M$ is not a maximum induced matching of $G$.

The claim in Lemma 3.10 can easily be proved using earlier techniques and Lemma 3.1 and Remark 3.2.

Remark 3.11. It should be noted from the previous results and from Corollary 3.9 that if $M$ is the maximum induced matching of $G_{5, m}, m \equiv 3 \bmod 4$, then at most, $M$ contains two edges of the form $u_{(1,2)} v_{i}, u_{(1,2)} v_{j}$ and $j$ can only be 4 when $i=1$ or $i$ can only be $m-3$ when $j=m$.

Theorem 3.12. Let $M$ be the maximum induced matching of $G$, a $G_{5, m}$ grid, with $m \geq 7, m=4 k+3$ and $k \geq 1$. Let $M$ contain $u_{(1,2)} v_{1}$ and $u_{(1,2)} v_{4}$ (or $u_{(1,2)} v_{m-3}$ and $\left.u_{(1,2)} v_{m}\right)$. Then there are at least $2 k+2$ saturated vertices on $U_{1} \subset G$.

Proof. For $u_{(1,2)} v_{1}$ and $u_{(1,2)} v_{4}$ to be in $M$, either $u_{(4,5)} v_{4} \in M$ or $u_{5} v_{(3,4)} \in M$. Now, let $\left\{V_{6}, V_{7}, \cdots, V_{m}\right\}$ induce $G^{|m(1)|} \subset G$. Clearly, $|m(1)| \equiv 2 \bmod 4$ and $\left|V_{s t}\left(G^{|m(1)|}\right)\right|=10 k-4$.

Let $G^{|m(1)|} \backslash\left\{u_{1} v_{6}, u_{1} v_{7}, \cdots, u_{1} v_{m}\right\}$ induce $G^{|m(2)|} \subset G^{|m(1)|}$. Then, $G^{|m(2)|}$ is a $G_{4, m-5}$ subgraph of $G^{|m(1)|}$. Now, $\left|V_{s t}\left(G^{|m(2)|}\right)\right| \leq 8 k-4$. Thus for $V\left(U_{1}\right) \subset$ $V\left(G^{|m(1)|}\right),|V(U)| \geq 2 k$. Thus, $U_{1}$ contains at least $2 k+2$ (i.e. $\frac{m-1}{2}$ ) saturated vertices.

Next we investigate $G_{3, m}$, where $m \equiv 3 \bmod 4$.
Lemma 3.13. Suppose that $G$ is a $G_{3, m}$ grid with $m \equiv 3 \bmod 4$ and $M$ is an induced matching of $G_{3, m}$, with $\left\{u_{(1,2)} v_{i}, u_{(1,2)} v_{i+2}, u_{(1,2)} v_{j}, u_{(1,2)} v_{j+2}\right\} \in M$ and $i+2 \geq j$. Then $M$ is not a maximum induced matching of $G$.
Proof. Suppose $i+2 \geq j$. Since $m=4 k+3,\left|V_{s b}(G)\right|=6 k+5$ and $\left|V_{s t}(G)\right|=6 k+4$. Thus, $G$ contains at most one $F S V$ vertex. Now from the conditions in the hypothesis, it is clear that $u_{3} v_{i+1}$ and $u_{3} v_{j+1}$ are $F S V$ members in $G$, which is a contradiction. Same argument hold if $i+2=j$ since both $u_{3} v_{i+1}$ and $u_{3} v_{i+3}$ are $F S V$ vertexes in $G$.

Remark 3.14. Suppose that $G_{n}$ is $G_{3, n}$, a subgrid of $G_{3, m}$ and induced by $\left\{V_{i+1}, V_{i+2}, \cdots, V_{i+n}\right\}$ and $G^{\prime}$ is a subgraph of $G$, with $G^{\prime}=G_{n}+\left\{u_{3} v_{i}, u_{3} v_{i+n+1}\right\}$, then the following are easy to verify. For
(a) $n \equiv 0 \bmod 4,\left|V_{s t}\left(G^{\prime}\right)\right| \leq\left|V_{s b}\left(G_{n}\right)\right|+2$.
(b) $n \equiv 1 \bmod 4,\left|V_{s t}\left(G^{\prime}\right)\right| \leq\left|V_{s b}\left(G_{n}\right)\right|+2$.
(c) $n \equiv 2 \bmod 4,\left|V_{s t}\left(G^{\prime}\right)\right|=\left|V_{s b}\left(G_{n}\right)\right|$.
(d) $n \equiv 3 \bmod 4,\left|V_{s t}\left(G^{\prime}\right)\right| \leq\left|V_{s b}\left(G_{n}\right)\right|+1$.

Lemma 3.15. Let $u_{(1,2)} v_{j}, u_{(1,2)} v_{j+3}, u_{(1,2)} v_{k}, u_{(1,2)} v_{k+3}, u_{(1,2)} v_{l}, u_{(1,2)} v_{l+3}$ be in $M$ an induced matching of $G$ a $G_{3, m}$ grid and $m \equiv 3 \bmod 4$. Then $M$ is not maximum induced matching of $G$.

Proof. Case 1: $j+3=k$ and $l=k+3$.
Suppose $m=4 p+3$ and $G^{|m(1)|}$ is a subgraph of $G$, induced by $\left\{V_{j-1}, V_{j}, \cdots, V_{i+4}\right\}$. Then $|m(1)|=12$ and $u_{3} v_{j-1}, u_{3} v_{i+4} \in F S V$. For one of $u_{3} v_{j-1}$ and $u_{3} v_{i+4}$ to be relevant for $M$ to be a maximum induced matching of $G$, say $u_{3} v_{j-1}$, then for $G^{|m(2)|}$, induced by $\left\{V_{1}, V_{2}, \cdots, V_{j-2}\right\},\left|V_{s b}\left(G^{|m(2)|}\right)\right|$ must be odd, which can only be if $j-2 \equiv 3$ $\bmod 4$. Suppose $j-2 \equiv 3 \bmod 4$, then $\left|V_{s t}\left(G^{|m(2)|}\right)+u_{3} v_{j-1}\right| \leq\left|V_{s b}\left(G^{|m(2)|}\right)\right|+1=$ $6 q+6$, where $|m(2)|=4 q+3$, for $q \geq 1$, since $|m(1)|=12$ and $|n(2)| \equiv 3 \bmod 4$. Now let $G^{|m(3)|}=G^{|m(1)|} \cup G^{|m(2)|}$, where $|m(3)|=|m(1)|+|m(2)| \equiv 3 \bmod 4$ and $G^{|m(4)|} \subset G$ be defined as a subgrid of $G$ induced by $\left\{V_{i+5}, V_{i+6}, \cdots, V_{m}\right\}$. Clearly, $|m(4)| \equiv 0 \bmod 4$. Since $\left|V_{s b}\left(G^{|m(4)|}\right)\right|=\left|V_{s t}\left(G^{|m(4)|}\right)\right|$, which is even, then $\left|V_{s t}\left(G^{|m(4)|} \cup u_{3} v_{i+4}\right)\right|=\left|V_{s t}\left(G^{|m(4)|}\right)\right|=6 p-6 q-18$. It can be seen that $\left|V_{s t}\left(G^{|m(1)|}\right) \backslash\left\{u_{3} v_{j-1}, u_{3} v_{l+4}\right\}\right|=14$. Therefore, $\left|V_{s t}(G)\right| \leq 6 p+2$ instead of $6 p+4$, and hence a contradiction.
Case 2: $j+3<k$ and $k+3<l$.
As in Case 1 and without loss of generality, let $j-2 \equiv 3 \bmod 4$ and let $G^{|m(2)|}$ still be induced by $\left\{V_{1}, V_{2}, \cdots, V_{j-2}\right\}$. Also, let $G^{|m(4)|}$ be induced by $\left\{V_{l+5}, V_{l+6}, \cdots, V_{m}\right\}$, and set $|m(4)| \equiv 3 \bmod 4$. Thus, $u_{3} v_{j-1}$ and $u_{3} v_{i+4}$ are both relevant for $M$ to be a maximum induced matching of $G,\left|V_{s t}\left(G^{|m(2)|} \cup V_{j-1}\right)\right|=\left|V_{s b}\left(G^{|m(2)|}\right)\right|+1$ and $\left|V_{s t}\left(G^{|m(4)|} \cup V_{l+4}\right)\right|=\left|V_{s b}\left(G^{|m(4)|}\right)\right|+1$. Set $G^{|m(2)|} \cup V_{j-1}=G^{\left|m\left(2^{+}\right)\right|}$and $G^{|m(4)|} \cup$ $V_{i+4}=G^{\left|m\left(4^{+}\right)\right|}$also let $\left\{V_{j}, V_{j+1}, V_{j+2}, V_{j+3}\right\}$ and $\left\{V_{i}, V_{i+1}, V_{i+2}, V_{i+3}\right\}$ induce $G^{|m(5)|}$ and $G^{|m(6)|}$, respectively. Furthermore, let $G^{\left|m\left(5^{+}\right)\right|}=G^{|m(5)|} \cup V_{j+4}$ and $G^{\left|m\left(6^{+}\right)\right|}$ contain, say, $h$ columns of $V_{i}$ in all, where $h \equiv 2 \bmod 4$. Therefore, for $G^{|(m(7))|}=$ $G \backslash\left\{G^{\left|m\left(2^{+}\right)\right|} \cup G^{\left|m\left(4^{+}\right)\right|} \cup G^{\left|m\left(5^{+}\right)\right|} \cup G^{\left|m\left(6^{+}\right)\right|}\right\},|m(7)|=m-h=b \equiv 1 \bmod 4$. Let $b=4 a+1$, for some positive integer $a$ and let $G^{|m(4)|} \subset G^{|m(7)|}$, where $G^{|m(7)|}$ is induced by $\left\{V_{k}, V_{k+1}, V_{k_{2}}, V_{k+3}\right\}$. Certainly, $u_{3} v_{k-1}, u_{3} v_{k+4}, u_{3} v_{j+4}, u_{3} v_{l-1} \in V_{s b}(G)$. Now, let $G^{|(4)|}$ be induced by $\left\{V_{k}, V_{k+1}, V_{k+2}, V_{k+3}\right\}$ and $G^{\left|4^{++}\right|}$be induced by $G^{|(4)|} \cup$ $\left\{V_{k-1}, V_{k+4}\right\}$, with $|4++|=6$. So, $b-6 \equiv 3 \bmod 4$, which is odd and thus can only be the sum of an even and an odd positive integer. Therefore, let $G^{|m(8)|}$ and $G^{|m(9)|}$ be induced by $\left\{V_{j+5}, V_{j+6}, \cdots, V_{k-2}\right\}$ and $\left\{V_{j+5}, V_{j+6}, \cdots, V_{l-2}\right\}$, respectively, with $|m(8)|+|m(9)|=b$. Suppose thus, that $|m(8)| \equiv 0 \bmod 4$, then, $|m(9)| \equiv 3 \bmod 4$ and suppose $|m(8)| \equiv 1 \bmod 4$, then $|m(9)| \equiv 2 \bmod 4$. For $|m(8)| \equiv 0 \bmod 4$, let
$G^{|m(10)|}=G^{\left|m\left(2^{+}\right)\right|+\left|m\left(5^{+}\right)\right|}$be $G^{\left|m\left(2^{+}\right)\right|} \cup G^{\left|m\left(5^{+}\right)\right|}$and $G^{|m(11)|}=G^{\left|m\left(6^{+}\right)\right|+\left|m\left(4^{+}\right)\right|}$be $G^{\left|m\left(6^{+}\right)\right|} \cup G^{\left|m\left(4^{+}\right)\right|}$, where $\left|m\left(2^{+}\right)\right|+\left|m\left(5^{+}\right)\right|=4 q+9$ and $\left|m\left(4^{+}\right)\right|+\left|m\left(6^{+}\right)\right|=4 r+9$, where $|m(4)|=4 r+3$. Therefore, as defined, $b=|m(7)|=4 p-4 q-4 r-15$ and thus $b-6=4(p-q-r-6)+3$. Set $p-q-r-6=f$. Now, for $|m(8)|$ and $|m(9)|$, if $|m(8)|=4 g$, for some positive integer $g$, then $|m(9)|=4(f-g)+3$. The maximal values of the subgrid of $G$ is: $\left|V_{s t}(G)\right| \leq\left|V_{s t}\left(G^{\left|m\left(2^{+}\right)\right|} \cup G^{|m(5)|}\right)\right|+\left|V_{s t}\left(G^{|m(8)|}+\left\{u_{3} v_{j+4}, u_{3} v_{k-1}\right\}\right)\right|$ $+\left|V_{s t}\left(G^{|m(4)|}\right)\right|+\left|V_{s t}\left(G^{|m(9)|}+\left\{u_{3} v_{k+4}, u_{3} v_{l-1}\right\}\right)\right|+\left|V_{s t}\left(G^{|m(6)|} \cup G^{\left|m\left(4^{+}\right)\right|}\right)\right| \leq 6 p+2$, which is less than $6 p+4$ and hence a contradiction. For $|m(8)| \equiv 1 \bmod 4$, and $|m(9)| \equiv 2 \bmod 4$, we have $|m(8)|=4 g+1$ and hence $|m(9)|=4(f-g)+2$ and $\left|V_{s t}\left(G^{|m(9)|} \cup\left\{u_{3} v_{k+4}, u_{3} v_{l-1}\right\}\right)\right|=6(f-g)+4$ and thus, $\left|V_{s t}(G)\right| \leq 6 p+2$.
Case 3: $j+3=k$ or $k+3=i$.
Suppose as in Case $2, j-2 \equiv 3 \bmod 4$ and $m-(i+4) \equiv 3 \bmod 4$. Let $G^{|n(1)|} \subset$ $G$, a $G_{3,9}$ subgrid of $G$ be induced by $\left\{V_{j-1}, v_{j}, \cdots, V_{j+7}\right\}$. Then for $G^{|n(2)|}=$ $G^{|m(2)|} \cup G^{|n(1)|},|n(2)|=|m(2)|+|n(1)|,|n(2)| \equiv 0 \bmod 4$. Likewise, suppose $\left\{V_{i-1}, V_{i}, \cdots, V_{m}\right\}$ induces $G^{|n(3)|}$, for which $|n(3)| \equiv 1 \bmod 4$. If $|n(2)|$ and $|n(3)|$ are $4 q$ and $4 r+1$ respectively, then $|n(4)| \equiv 2 \bmod 4$. So far, $G^{|n(4)|}$, is induced by $\left\{V_{i+8}, V_{i+9}, \cdots, V_{l-2}\right\}$ and by Remark 3.14, $\left|V_{s t}\left(G^{|n(4)|}\right)+\left\{u_{3} v_{j+7}, u_{3} v_{l-1}\right\}\right|=$ $\left|V_{s b}\left(G^{|n(4)|}\right)\right|$. By a summation similar to the one at the end of Case $2,\left|V_{s t}(G)\right| \leq$ $\left|V_{s t} G^{|n(2)|}\right|+\left|V_{s t}\left(G^{|n(4)|}\right)\right|+\left|V_{s t}\left(G^{|n(3)|}\right)\right| \leq 6 p+2$.

## Remark 3.16.

(a) By following the technique employed in Lemma 3.15, it can be established that given $u_{(1,2)} v_{i}, u_{(1,2)} v_{i+2} \in M$ and $u_{(1,2)} v_{j}, u_{(1,2)} v_{j+2} \in M$ of $G$, a $G_{3, m}$ grid, $m \equiv 3 \bmod 4, i+2 \leq j$, then $M$ is not a maximum induced matching of $G$.
(b) Let $M$ be an induced matching of $G$, a $G_{3, m}$ grid, and $i$ be some fixed positive integer. Suppose $u_{\left(1_{2}\right)} v, i+8(n) \in M$, for all non-negative integer $n$ for which $1 \leq i+8(n) \leq m$. Let $M$ be the maximum induced matching of $G$. Then,
(i) if $i>1$, then $i-1$ is either $2,3,4$ or 6 ;
(ii) if $i+8(n)<m$, for the maximum value of $n$, then $m-(i+8(n))$ is either $2,3,4$ or 6 .

Based on the results so far, we note that if $M$ is the maximum induced matching of $G$, a $G_{3, m}$ grid, $m \equiv 3 \bmod 4, m \geq 11$, the maximum number of edges of the type $u_{(1,2)} v_{k}$ that is contained in $M, k$, a positive integer, is $k+2$ when $m=8 k+3$ and $k+3$ when $m=8 k+7$.

It can be easily established that for $H$ that is a $G_{k, m}$ grid, with $k \equiv 0 \bmod 4$ and $m \equiv 3 \bmod 4$, which is induced by $\left\{U_{1}, U_{2}, \cdots, U_{k}\right\}$, if $M_{1}$ is a maximum induced matching of $H$, then, the least saturated vertices in $U_{k}$ is $\frac{m-1}{2}$. The next result describes the positions of the members of $M_{1}$ in $E(H)$ if $U_{k}$ contains $\frac{m-1}{2}$ saturated vertices.

Lemma 3.17. Let $H$ be a $G_{k, m}$ grid with $k \equiv 0 \bmod 4$ and $m \equiv 3 \bmod 4$ and let $U_{k}$ contain the least possible, $\frac{m-1}{2}$, saturated vertices for which $N$ remains maximum induced matching of $H$. Then, for any adjacent vertices $v^{\prime}, v^{\prime \prime} \in U_{k}$, edge $v^{\prime} v^{\prime \prime} \notin M$.

Proof. Induced by $\left\{U_{1}, U_{2}, \cdots, U_{k-2}\right\}$ and $\left\{U_{k-1}, U_{k}\right\}$ respectively, let $G_{1}^{|m|}$ and $G_{2}^{|m|}$ be partitions of $H$ with $k-2 \equiv 2 \bmod 4$. It can be seen that $\left|V_{s t}\left(G_{1}^{|m|}\right)\right|=$ $\left|V_{s b}\left(G_{1}^{|m|}\right)\right|=\frac{k m-2 m+2}{2}$. Since $\left|V_{s t}(H)\right|=\frac{k m}{2}$, then $\left|V_{s t}\left(G_{2}^{|m|}\right)\right| \leq m-1$. Now, let $G_{3}^{|m|}$ be a $G_{1, m}$ subgrid (a $P_{m}$ path) of $H$, induced by $U_{k}$. By the hypothesis, $U_{k}$ contains maximum of $\frac{m-1}{2}$ saturated vertices. Now, let $u_{k} v_{i}, u_{k} v_{i+1}$ be adjacent and saturated vertices of $G_{3}^{|m|}$. Then there are $\frac{m-5}{2}$ other saturated vertices on $G_{3}^{|m|}$. Without loss of generality, suppose that each of the remaining $\frac{m-5}{2}$ saturated vertices in $G_{3}^{|m|}$ is adjacent to some saturated vertex in $U_{k-1}$. Now, suppose $u_{k-1} v_{j}$ is a saturable vertex in $U_{k-1}$ and that $v \in V(H)$, such that $u_{k-1} v_{j} v \in M_{1}$. Now, $v \notin U_{k}$, since all the saturable vertices in $U_{k}$ is saturated. Likewise, suppose $v \in U_{k-1}$ and then $u_{k-1} v_{j} v \in$ $E\left(G_{4}^{|m|}\right)$, where $G_{4}^{|m|}$ is a $G_{1, m}$ subgraph of $H$ induced by $U_{k-1}$. Then, clearly, at least one of $u_{k-1} v_{j}$ and $v$ is adjacent to a saturated vertex in $V_{s t}\left(G_{1}^{|m|}\right)$. Also, suppose that $v \in U_{k-2}$, since $\left|V_{s b}\left(G_{1}^{|m|}\right)\right|=\left|V_{s t}\left(G_{1}^{|m|}\right)\right|$, then $\left|V_{s t}\left(G_{1}^{|m|}\right)\right|=\left|V_{s t}\left(G_{1}^{|m|}+u_{k-1} u_{j}\right)\right|$. Hence $v \in F S V$ in $G_{1}^{|m|}$. Therefore, $\left|V_{s t} H\right| \leq\left|V_{s t} G_{1}^{|m|}\right|+\left|V_{s t} G_{2}^{|m|}\right| \leq \frac{k m-4}{2}$, which is a contradiction since $\left|V_{s t}(H)\right|=\frac{k m}{2}$, by [9].

Remark 3.18. The implication of Lemma 3.17 is that for a grid $H^{\prime} \subset H$, which is induced by $\left\{U_{1}, U_{2}, \cdots, U_{k-2}\right\} \subset V(H), k-2 \equiv 2 \bmod 4$, suppose $U_{k}$ contains the least possible number of saturated vertices, $\frac{m-1}{2}$, then $u_{k} v_{2}, u_{k} v_{4}, \cdots, u_{k} v_{m-1}$ are saturated as shown in the example in Figure 3, for which $k=4$ and $m=7$.

Figure 3: A $G_{4,7}$ Grid with $\operatorname{Max}(G)=7$

Lemma 3.19. Let $G$ be a $G_{3, m}$ with an induced matching $M$ and $G^{|(9)|}$, induced by $\left\{V_{i}, V_{i+2}, \cdots, V_{i+8}\right\}$ be a $G_{3,9}$ subgrid of $G$. Suppose that $M^{\prime} \subset M$ is an induced matching of $G^{|(9)|}$ such that $u_{(1,2)} v_{i}, u_{(1,2)} v_{i+8} \in M^{\prime}$. No other edge $u_{(1,2)} v_{i+t}, 1<t<$ $i+7$ is contained in $M^{\prime}$. Then for $G^{\prime|(9)|} \subset G^{|(9)|}$, defined as $G^{|(9)|} \backslash U_{1},\left|V_{s b}\left(G^{\prime|(9)|}\right)\right| \leq$ 8.

Proof. Let $G^{|(7)|}=G^{|(9)| \mid} \backslash\left\{\left\{u_{1} v_{i+1}, u_{i} v_{i+2}, \cdots, u_{1} v_{i+7}\right\}, V_{i}, V_{i+8}\right\}$. It can be seen that $G^{|(7)|}$ is a $G_{2,7}$ subgrid of $G^{|(9)|}$. Clearly also, $G^{|(7)|} \subset G^{\prime|(9)|}$. Since
$u_{(1,2)} v_{i}, u_{(1,2)} v_{i+8} \in M^{\prime}$, then, $u_{2} v_{i+1}$ and $u_{2} v_{i+7}$ can not be saturated. Let $G_{y}$ be subgraph of $G^{|(7)|}$, defined as $G^{|(7)|} \backslash\left\{u_{2} v_{i+1}, u_{2} v_{i+7}\right\}$. Now, $\left|V\left(G_{y}\right)\right|=12$ and $\left|V_{s b}\left(G_{y}\right)\right|$ can be seen to be at most 6 . Thus $\left|V_{s b}\left(G^{\prime|(9)|}\right)\right|=\left|V_{s b}\left(G_{y}\right)\right|+2=8$, since $u_{2} v_{i}$ and $u_{2} v_{i+8}$ are saturated in $M^{\prime}$.

Remark 3.20. For $U_{1} \subset G^{|(9)|}$ as defined in Lemma 3.19, $U_{1}$ contains at least 6 saturated vertices, implying that $M^{\prime}$ contains two edges whose four vertices are from $U_{1}$.

Corollary 3.21. Let $G$ be a $G_{3, m}$ grid with $m \geq 11$ and $m \equiv 3 \bmod 4$. If $M^{\prime}$ is a maximum induced matching of $G$. Then $M^{\prime}$ contains at least $2 k^{\prime}$ edges from $U_{1}$, where $m=8 k^{\prime}+3$ or $m=8 k^{\prime}+7$.

Figure 4: A $G \equiv G_{3,23}$ Grid with $\operatorname{Max}(G)=17$

Figure 5: A $G \equiv G_{3,19}$ Grid with $\operatorname{Max}(G)=14$

Theorem 3.22. Let $G$ be a $G_{n, m}$ grid, with $m \geq 23$. Then for $n \equiv 1 \bmod 4$, $\operatorname{Max}(G) \leq\left\lfloor\frac{2 m n-m-3}{8}\right\rfloor$.

Proof. For $n \equiv 1 \bmod 4, n-5 \equiv 0 \bmod 4$. Let $G_{1}$ and $G_{2}$ be partitions of $G$ induced by $\left\{U_{1}, U_{2}, \cdots, U_{n-5}\right\}$ and $\left\{U_{n-4}, U_{n-3}, U_{n-2}, U_{n-1}, U_{n}\right\}$ respectively. Also, let $M^{\prime}, M^{\prime \prime}$ be maximum induced matching of $G_{1}$ and $G_{2}$ respectively.

Suppose, $U_{n-5}$ contains at least $\frac{m-1}{2}$ saturated vertices, the least $U_{n-5}$ can contain for $M^{\prime}$ to remain maximum induced matching of $G_{1}$. By Theorem 3.12, $U_{1} \subset G_{2}$ (the $U_{n-4}$ of $G$ ) contains at least $2 k+2$ saturated vertices with $k=\frac{m-3}{4}$. Following the proof of Theorem 3.12, it is shown that $M^{\prime \prime}$ contains $\frac{m-3}{4}$ edges of $U_{1} \subset G_{2}$ and either
of $u_{(1,2)} v_{4}$ and $u_{(1,2)} v_{m-3}$. Now, with $G=G^{\prime} \cup G^{\prime \prime}$ and hence, $|M| \leq\left|M^{\prime}\right|+\left|M^{\prime \prime}\right|$, it is obvious therefore, that for each edge $u_{\alpha} u_{\beta} \in U_{n-4}$ contained in $M^{\prime \prime}$, either $u_{\alpha}$ or $u_{\beta}$ is adjacent to a saturated vertex on $U_{n-5}$ and also, $u_{n-4} v_{4}$ (or $u_{n-4} v_{m-3}$ ) is adjacent to saturated $u_{n-5} v_{4}$ (or to saturated $u_{n-4} v_{m-3}$ ). Hence, $\left|V_{s t}(G)\right| \leq \frac{2 m n-m-7}{4}$ and thus, $\operatorname{Max}(G) \leq\left\lfloor\frac{2 m n-m-7}{8}\right\rfloor$.

Theorem 3.23. Let $G$ be a $G_{n, m}$ grid with $n \equiv 3 \bmod 4$ and $m \equiv 3 \bmod 4, m \geq 11$. Then $\operatorname{Max}(G) \leq\left\lfloor\frac{2 m n-m+1}{8}\right\rfloor$ and $\operatorname{Max}(G) \leq\left\lfloor\frac{2 m n-m+5}{8}\right\rfloor$ for $m=8 k^{\prime}+3$ and $m=8 k^{\prime}+7$ respectively.

Proof. The proof follows similar techniques as in Theorem 3.22.
